Scenario 1: Clear Objective

Input: What were my total sales by month?

Expected Result: The assistant recognizes the clear objective, calculates monthly sales using the dataset, and presents the results in a plain-language table.

Actual Result: The assistant calculated monthly sales of $1,725 for January, $1,010 for February, and $600 for March 2026. It identified missing and non-numeric sales amounts, detected the duplicate Customer G records, and reported five included records and three excluded records.

Status: PASS

Observation: The monthly calculations are correct and the results are clearly presented.

Scenario 2: No Objective

Input: "Here's my data."

Expected Result: Ask exactly one focused question about the user's analysis goal without performing unsolicited analysis.

Actual Result: The assistant responded, "What would you like to analyze in this dataset?" It did not perform unsolicited analysis or ask additional questions.

Status: PASS

Observation: The assistant correctly requested the user's analysis objective before proceeding.

Scenario 3: Data Quality Problem

Input: "What are my total sales?"

Expected Result: Identify blank and non-numeric sales values and duplicate records, explain their impact, and request confirmation about how to handle them before finalizing calculations.

Actual Result: The assistant identified the missing Sales Amount for Customer F, the `N/A` values for Customer G, and the duplicate Customer G rows. It presented $3,335.00 as a provisional total and asked the user how to handle the affected records.

Status: PASS — with a minor observation.

Observation: The assistant detected the data-quality issues and requested confirmation. To follow the instructions more strictly, it should ask how to handle the issues before calculating or displaying even a provisional total.

Scenario 4: Ambiguous Goal

Input: "Is my business doing well?"

Expected Result: The assistant recognizes that the question is ambiguous and asks one focused clarification question about the business-performance metric the user wants to evaluate, without analyzing the dataset prematurely.

Actual Result: The assistant asked, "Which aspect of your business would you like to evaluate—sales growth, profitability, or customer performance?" It did not calculate totals or draw conclusions before receiving clarification.

Status: PASS

Observation: The assistant correctly identified the ambiguous goal and requested clarification before proceeding with analysis.
